## ALIRAN KOMPLEKS YANG TERINSPIRASI DARI ALAM

Lavi Rizki Zuhul

Tantangan utama dalam aplikasi ilmu aerodinamika dan mekanika fluida pada bidang rekayasa dirgantara saat ini bukan lagi terfokus pada desain wahana yang dapat bergerak lebih cepat. Fokus utama telah bergeser kepada bagaimana merancang wahana yang lebih efisien dan ramah lingkungan. Masalah efisiensi ini berkaitan erat dengan pengurangan gaya hambat, yang meskipun merupakan permasalahan klasik, tetap menjadi tantangan besar dalam aerodinamika hingga saat ini. Pemahaman tentang bagaimana mengurangi gaya hambat akibat gesekan fluida akan berdampak pada penghematan penggunaan bahan bakar dari berbagai wahana transportasi, termasuk pesawat terbang. Dampak ekonominya akan sangat signifikan, karena wahana transportasi menggunakan triliunan galon bahan bakar per tahunnya.

Tantangan berikutnya adalah terkait dengan usaha pencarian suatu sistem propulsi baru untuk

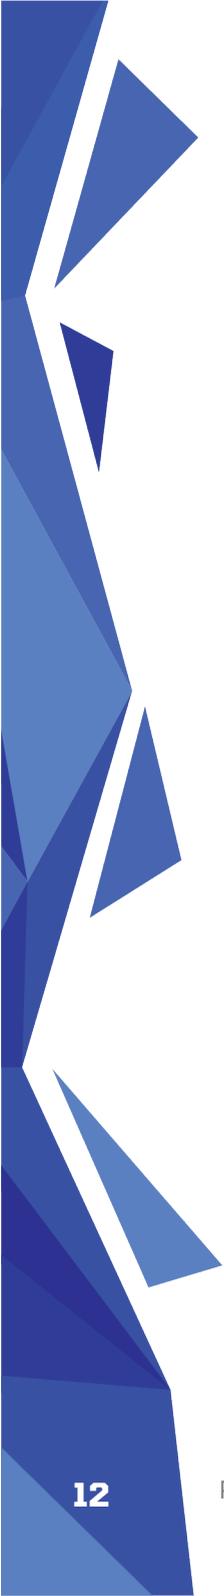

wahana tanpa awak berukuran kecil, baik untuk wahana tanpa awak udara *micro unmanned aerial vehicle (micro UAV)*, maupun wahana bawah air *autonomous underwater vehicle (AUV)*. Wahana otonom ini dirancang untuk melakukan suatu fungsi pekerjaan yang sangat berbeda dengan UAV/*drone* yang ada saat ini. Misalnya, kebutuhan untuk merancang *micro-UAV* yang mampu terbang melayang (*hover*) agar dapat melakukan berbagai pekerjaan sambil terbang, seperti seekor serangga yang dapat melayang sambil bekerja/makan. Contoh lain adalah kebutuhan akan wahana AUV yang senyap dan mampu bermanuver dengan lincah di air, layaknya seekor ikan. Wahana-wahana otonom seperti ini diprediksi akan banyak diperlukan di masa yang akan datang, untuk berbagai keperluan, mulai dari inspeksi dan perbaikan, pencarian dan penyelamatan, medis, intelijen, hingga militer. Sistem propulsi yang ada saat ini belum dapat memenuhi keperluan tersebut. Oleh karena itu, diperlukan suatu sistem propulsi baru untuk wahana semacam ini.

Salah satu alternatif untuk menjawab berbagai tantangan di atas adalah dengan mengambil inspirasi dari aliran yang dijumpai di alam semesta. Sebagai contoh untuk mengurangi gaya hambat, kita dapat mempelajari bagaimana aliran di sekitar sisik ikan hiu yang relatif kasar malah dapat menghasilkan gaya gesek yang rendah. Contoh lainnya adalah bagaimana pembangkitan gaya dan momen yang dihasilkan oleh kepakan sayap burung atau serangga memungkinkan hewan-hewan tersebut dapat bermanuver dengan lincah dan stabil. Pemahaman fenomena aliran yang terinspirasi dari alam ini berpotensi untuk dimanfaatkan dalam pengembangan teknologi masa depan yang lebih maju dan ramah lingkungan.

Mayoritas aliran fluida yang dijumpai di alam adalah aliran fluida tak-tunak yang didominasi oleh pembangkitan dan interaksi vorteks, yang jauh lebih

kompleks dari pada aliran di sekitar wahana buatan manusia saat ini. Sayap pesawat terbang dirancang agar aliran udara yang bergerak di sekitarnya menempel pada permukaan sayap (*attached flows*). Aliran yang menempel ini diatur sedemikian rupa agar menghasilkan distribusi tekanan, yang akan membangkitkan gaya dan momen aerodinamika, termasuk gaya angkat. Sementara itu, aliran fluida yang dijumpai pada hewan adalah aliran di sekitar permukaan benda yang bergerak dan mengalami perubahan bentuk. Aliran yang dihasilkan adalah aliran fluida tak-tunak (*unsteady flow*) yang lepas dari permukaan (*separated flows*) pada bagian belakang benda. Lapisan geser (*shear layer*) dari aliran lepas ini kemudian menggulung dan membentuk vorteks (pusaran), sehingga aliran seperti ini cenderung akan didominasi oleh vorteks (*vortex dominated flows*). Berbagai vorteks yang terbentuk akan berinteraksi satu sama lain dan juga dengan permukaan benda dalam suatu proses pembangkitan gaya dan momen pada aliran tipe ini. Diperlukan pemahaman fenomena fisik yang cukup dalam agar interaksi vorteks dapat dimanipulasi sedemikian rupa guna menghasilkan gaya dan momen yang diinginkan. Pemahaman ini dimiliki secara natural oleh hewan yang terbang di udara dan yang berenang di air. Namun, cara memanipulasi aliran fluida tak-tunak yang didominasi oleh pembangkitan dan interaksi vorteks masih belum terlalu dipahami oleh manusia hingga saat ini.

Berbagai permasalahan terkait aliran fluida yang dibahas pada beberapa paragraf sebelumnya telah menjadi topik-topik riset dari penelitian yang penulis lakukan selama lebih dari 20 tahun terakhir di Fakultas Teknik Mesin dan Dirgantara (FTMD) ITB, bersama-sama dengan para kolega dan puluhan mahasiswa bimbingan. Mayoritas dari penelitian yang dilakukan adalah untuk aliran berkecepatan rendah (dengan

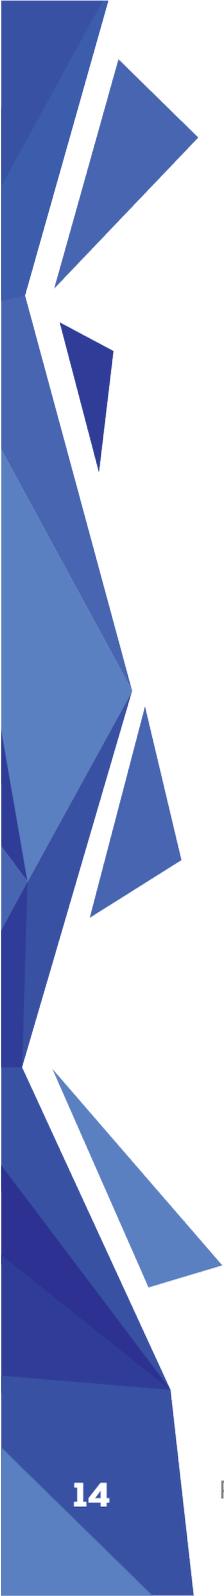

bilangan Reynolds yang rendah). Juga, aliran yang pelajari sebagian besar adalah aliran di sekitar benda (*external flows*). Namun, permukaan benda yang dipelajari mengalami perubahan terhadap waktu. Perubahan pada permukaan dapat berupa pergerakan permukaan sebagai benda kaku (*rigid body*), ataupun benda yang mengalami deformasi pada permukaan. Pada beberapa kasus, perubahan permukaan benda yang dikaji mengalami deformasi yang diakibatkan oleh interaksi permukaan dengan fluida (*fluid structure interaction/FSI*). Kompleksitas aliran dari kasus yang dikaji adalah sedemikian rupa sehingga memerlukan berbagai pengembangan metodologi analisis aliran yang baru untuk mempelajari fisika dari aliran tersebut.

Salah satu topik penelitian terkait hal ini adalah pengembangan metodologi eksperimental dengan memanfaatkan teknologi machine learning untuk mempelajari mekanisme pembangkitan gaya akibat adanya pergerakan dari permukaan benda. Setup eksperimen ini dikembangkan untuk memodelkan aliran yang dihasilkan oleh kepak sayap serangga maupun aliran yang dihasilkan oleh gerakan ikan ketika berenang di dalam air (Fathurrohim et al., 2022). Metode optimasi berbasis machine learning yang dikembangkan kemudian diperintahkan untuk mencari sendiri kinematika/gerak yang menghasilkan gaya yang paling optimal. Aliran yang dihasilkan oleh gerakan optimal tersebut kemudian dipelajari lebih lanjut untuk memahami proses fisika pembangkitan gaya tak tunak tersebut. Pemahaman aliran tipe ini akan membantu pengembangan sistem propulsi wahana masa depan, seperti *micro* UAV maupun AUV.

Penelitian lain adalah pengembangan metode komputasional fluida atau *computational fluid dynamics* (CFD) tanpa kisi-kisi (*meshless* CFD) berbasis partikel, yang dikembangkan agar dapat digunakan

untuk keperluan simulasi aliran di sekitar benda yang bergerak/berdeformasi. Salah satu metode CFD berbasis partikel yang pernah dikembangkan, adalah metode vortex particle method (VPM). VPM adalah metode CFD yang menyelesaikan persamaan *Navier-Stokes* dalam bentuk khusus, yang disebut bentuk Lagrangian. Sebagaimana metode berbasis partikel lainnya, algoritma VPM memiliki tingkat kompleksitas yang jauh lebih tinggi daripada algoritma CFD konvensional berbasis kisi-kisi, yang saat ini digunakan secara luas. Namun, apabila berhasil dikembangkan, VPM akan lebih mudah digunakan oleh pengguna dibandingkan CFD konvensional karena tidak memerlukan pembentukan kisi-kisi. Penelitian dengan topik VPM difokuskan ke pemodelan kondisi batas dengan menggunakan metode penalisis, yang dikembangkan untuk memastikan bahwa kondisi ini akan selalu terpenuhi dalam simulasi aliran kompleks. Metode VPM untuk keperluan tersebut sudah berhasil dikembangkan dan diaplikasikan untuk mempelajari berbagai kasus aliran kompleks (Duong, et al., 2021; Duong & Zuhail, 2022; Firdaus et al., 2023).

Selain CFD, metode komputasional untuk mekanika padatan atau *computational solid mechanics* (CSM) berbasis partikel juga telah dikembangkan oleh penulis dan tim peneliti FTMD. Metode CSM berbasis partikel yang dikembangkan menggunakan model diskritisasi *smoothed-particle hydrodynamics* (SPH). SPH awalnya dikembangkan untuk keperluan simulasi aliran fluida. Namun, kami melihat bahwa SPH sangat cocok untuk digunakan sebagai metode CSM berbasis partikel, yang akan digabungkan dengan VPM (yang juga berbasis partikel), untuk keperluan simulasi interaksi fluida-struktur. Kemampuan untuk dapat melakukan simulasi interaksi fluida-struktur dengan defleksi struktur yang besar, secara akurat adalah salah satu alasan utama kenapa penulis memilih

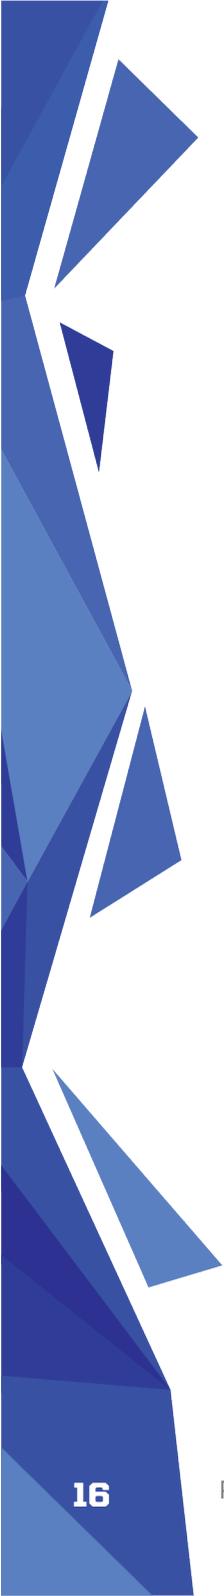

mengembangkan metode komputasional berbasis partikel. Fenomena yang seringkali dijumpai pada aliran di alam semesta ini sangat kompleks, baik dari sisi mekanika fluida maupun mekanika struktur, sehingga sangat sulit untuk mengendalikan parameter uji apabila dilakukan dengan menggunakan pendekatan eksperimental. Beberapa hasil riset pengembangan metode SPH untuk mekanika padatan telah diterbitkan dalam bentuk tulisan ilmiah di beberapa jurnal terkemuka di bidang terkait (Wiragunarsa et al., 2024a,b; Wiragunarsa et al., 2021).

Permasalahan kompleks yang dijumpai dalam bidang rekayasa dirantara seringkali melibatkan beberapa fenomena fisika yang berbeda secara bersamaan. Oleh karena itu, kami mengembangkan metode komputasional lain yang dikenal dengan sebutan *Lattice Boltzmann Method* (LBM), yang menyelesaikan persamaan Boltzmann. Secara umum, persamaan Boltzmann merupakan persamaan yang penting untuk memahami fenomena multifisika, yang melibatkan interaksi kompleks dalam berbagai sistem fisika seperti seperti dalam kasus interaksi fluida-struktur. LBM terkenal karena kemampuannya untuk menangani geometri kompleks dan fenomena multifisika dengan efisien. Keunggulan LBM meliputi kesederhanaan implementasi untuk geometri yang tidak teratur dan kemudahan dalam mensimulasikan masalah dengan batasan yang kompleks. Ini menjadikannya sangat berguna dalam aplikasi teknik, termasuk teknik dirantara. Hasil dari pengembangan LBM juga sudah kami manfaatkan untuk mempelajari fenomena aliran kompleks. Dalam tulisan Duong et al. (2024a), LBM digunakan untuk menangkap interaksi kompleks ulakan dari tiga benda yang diletakkan secara berurutan. Ini merupakan pemodelan dari aliran yang dihasilkan oleh beberapa *drones* yang bergerak di dekat suatu permukaan. Sementara itu,

dalam tulisan Duong et al. (2024b), LBM digunakan untuk mempelajari fenomena interaksi struktur koheren dari sistem vorteks yang dilepaskan oleh sebuah benda.

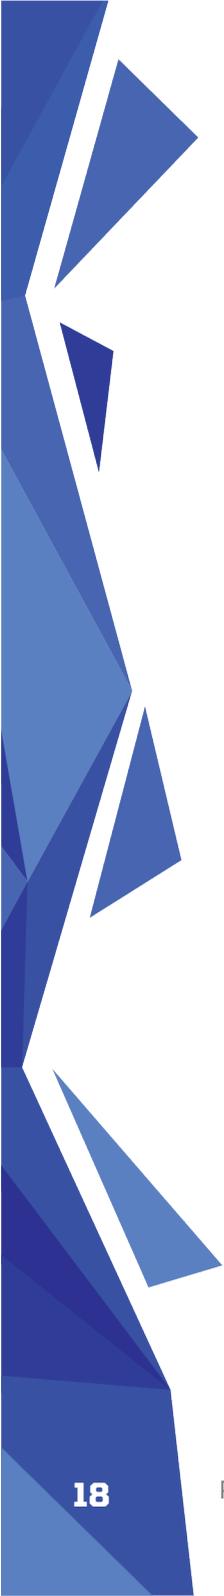

Selain untuk melakukan analisis dan mempelajari fenomena fisis, metode komputasional juga dapat dimanfaatkan untuk keperluan perancangan suatu sistem kompleks. Permasalahan utama dalam suatu proses perancangan dengan geometri kompleks menggunakan metode komputasi konvensional adalah mahalannya ongkos numerik yang diperlukan dalam mempersiapkan geometri dan kisi-kisi, yang pada proses perancangan perlu dilakukan secara berulang-ulang. Untuk mengatasi permasalahan ini, kami terlibat dalam pengembangan suatu metode numerik tanpa kisi-kisi baru yang disebut dengan metode kolokasi titik dengan menggunakan *mollified piecewise polynomial* (Alfarisy et al., 2024). Metode numerik baru ini digunakan untuk menyelesaikan persamaan diferensial parsial, yang merupakan model matematis dari suatu permasalahan teknik. Teknik ini melibatkan aproksimasi suatu fungsi menggunakan polinomial *piecewise* yang terhubung mulus pada batasnya sehingga menghindari diskontinuitas. Istilah *mollified* mengacu pada proses memperhalus fungsi-fungsi ini untuk memastikan bahwa fungsi-fungsi tersebut dapat terdiferensiasi pada titik-titik pertemuan segmen polinomial. Kontinuitas yang diberikan oleh molifikasi meningkatkan stabilitas dan konvergensi solusi numerik, yang menjadikannya sangat bermanfaat dalam menghadapi permasalahan dengan diskontinuitas atau ketidakstabilan yang banyak dijumpai di dalam permasalahan rekayasa. Metode numerik yang dikembangkan bersama-sama dengan mitra internasional ini berpotensi untuk mempermudah proses perancangan kompleks dari wahana dirgantara di masa depan.

Selama beberapa tahun terakhir, penulis dan tim peneliti di FTMD juga mengembangkan metode analisis fluida berbasis data yang memanfaatkan teknologi *machine learning*. Beberapa metode *machine learning* telah dikembangkan hingga dapat digunakan untuk mengolah data mekanika fluida untuk berbagai keperluan, seperti untuk perancangan maupun pemodelan. Salah satu contoh penelitian dengan topik ini adalah pengembangan metodologi optimasi perancangan aerodinamika berbasis *machine learning*. Dengan menggunakan metodologi optimasi perancangan yang kami kembangkan, proses perancangan dapat dilakukan secara otomatis dengan menggunakan model komputasional yang jauh lebih akurat daripada model yang digunakan dalam metode perancangan konvensional. Metode perancangan yang dikembangkan ini akan bermanfaat untuk menghasilkan rancangan yang jauh lebih baik dalam waktu yang lebih singkat, yang tentunya sangat diperlukan oleh berbagai industri rekayasa, termasuk industri dirgantara. Selain itu, hasil dari proses ini tidak hanya berupa satu titik desain optimum, tetapi juga memberikan informasi tentang seluruh ruang desain (*design space*). Informasi ini dapat dimanfaatkan untuk melakukan proses eksplorasi perancangan, seperti yang dipaparkan dalam tulisan Palar et al. (2023a). Beberapa metode yang kami kembangkan untuk keperluan ini, diantaranya adalah metode yang berbasis *Gaussian process regression* dan *polynomial chaos expansion* (Palar et al., 2018; Palar et al., 2020; Zuhail et al., 2021; Zuhail et al., 2023).

Topik penelitian lain adalah pemodelan aliran fluida berbasis data dengan menggunakan *machine learning*. Berbeda dengan optimasi perancangan, yang sebenarnya juga pemodelan namun dengan dimensi yang jauh lebih rendah, yang ingin diprediksi dari penelitian ini adalah medan aliran, yang memiliki harga

properti (seperti  $p, T, v$ ) di setiap titik dalam domain aliran. Oleh karena itu, metode *machine learning* yang dikembangkan untuk keperluan ini adalah metode *deep learning*. *Deep learning* memiliki kemampuan untuk memodelkan kasus dengan tingkat non-linearitas serta dimensi yang tinggi. Namun demikian, metode *deep learning* standar menghasilkan hubungan yang bersifat kotak-hitam. Walaupun hubungan kotak-hitam ini cukup akurat, tidak terdapat penjelasan keterkaitan antara masukan (input) dan luaran (output). Walaupun bermanfaat, penggunaan metode ini untuk keperluan analisis aliran fluida akan sulit untuk dapat diterima apabila tidak bisa memberikan penjelasan fisis dari keterkaitan antara masukan-keluaran yang dihasilkan. Untuk itu, kami mengembangkan metode *explainable deep learning* yang, tidak hanya memberikan hubungan masukan-keluaran semata, tetapi juga dapat memberikan penjelasan keterkaitan antara masukan-keluaran (Palar, Zuhar, et al., 2023b). Metode yang kami kembangkan untuk memprediksi medan aliran ini telah menunjukkan hasil yang cukup menjanjikan (Palar, Stevenseon, et al., 2023). Pada makalah Putra et al. (2022), prediksi medan aliran bahkan dilakukan tanpa data, melainkan dengan menggunakan persamaan *Navier-Stokes*, yang diselesaikan dengan menggunakan metode *physics informed neural network* (PINN). Baru-baru ini, metode *explainable deep learning* yang kami kembangkan berhasil digunakan untuk memprediksi tegangan *Reynolds* secara akurat, yang dihasilkan oleh suatu kasus aliran turbulen. Dengan prediksi ini, gaya gesek yang dihasilkan oleh aliran turbulen dapat diprediksi dengan lebih akurat. Kemampuan prediksi gaya gesek dengan akurat secara cepat pada kasus aliran turbulen akan sangat membantu dalam proses perancangan wahana dengan gaya hambat minimal, yang merupakan salah satu tantangan utama dalam bidang rekayasa dirgantara saat ini.

Sebagai kesimpulan, pergeseran fokus pada aspek keberlanjutan (*sustainability*) dan efisiensi energi akan mendorong penelitian di bidang teknik dirgantara ke arah pengembangan solusi yang lebih ramah lingkungan. Hal ini mencakup perancangan wahana dan sistem propulsi masa depan yang lebih efisien dengan kemampuan yang lebih tinggi. Dengan mengaplikasikan pengetahuan tentang aliran fluida kompleks yang terinspirasi alam dalam pengembangan teknologi inovatif yang memperhatikan aspek keberlanjutan, para peneliti bidang teknik dirgantara akan memainkan peran penting dalam membentuk masa depan yang lebih berkelanjutan bagi planet kita.

# REMOTE SENSING TECHNOLOGY INNOVATION, KEY TO INDONESIA TO LEAD THE WORLD

**Josaphat Tetuko Sri Sumantyo**

## **Background and Objective**

Landslides, earthquakes, subsidence, and other disasters frequently happen on Earth's surface that affect human activities. Therefore, all-weather and night-daytime available accurate sensor is needed. Hence, the Josaphat Microwave Remote Sensing Laboratory (JMRS�, n.d) of the Center for Environmental Remote Sensing (CEReS) of Chiba University, Japan is promoting research and education on the system and application of circularly polarized synthetic aperture radar (CP-SAR). JMRS� collaborates with domestic and international institutions to develop multiband CP-SAR onboard unmanned aerial vehicles (UAV), aircraft, high altitude platform systems (HAPS), and microsatellites. Artificial intelligence (AI) was also implemented in the application development of CP-SAR images. This paper will introduce the development of advanced microwave sensors in Section II, AI image processing and its application in Section III, and education activities in Section IV.

## Development of Advanced Microwave Remote Sensors

### A. Roadmap and Facilities

Fig.1 shows the roadmap of JMRSI to develop advanced microwave remote sensors for disaster and environmental monitoring since 2005. JMRSI has been developed for the L, C, X, and K bands of CP-SAR with various payloads (1 to 80 kg) for UAVs, aircraft, HAPS, and microsattellites. JMRSI also has developing facilities including an anechoic chamber (1 to 40 GHz), a clean room, and manufacturing rooms, including some software for designing and testing the circuit, antenna, and material. The ground station was built for microsattelite control with the S-band for command and telemetry, and the X-band for data transfer. We also develop an original method to calibrate and validate the CP-SAR system in the anechoic chamber and flight mission.

## B. Circularly Polarized Synthetic Aperture Radar (CP-SAR)

The original hardware and software of CP-SAR and antennas were developed in JMRS. Fig.1 shows the Josaphat Laboratory Unmanned Aerial Vehicle (JX series) for the flight mission of CP-SAR. The L band (center frequency of 1.275 GHz) CP-SAR system was developed and had the first flight test in 2012 (Nonami et al., 2013).

JMRS also developed the C and X bands CP-SAR and had flight missions on the aircraft of Cessna 172, CN235MPA, and Boeing 737-200 from 2017 to 2018 (Sri Sumantyo, Yam, et al., 2021; Sri Sumatyo, Chua, et al., 2023). Fig.4 shows the example of full polarimetric images of CP-SAR that were recorded in our flight mission in May 2018 at Makassar, Indonesia (Sri Sumantyo, Yam, et al., 2021; Sri Sumatyo, Chua, et al., 2023).

JMRSL also developed an L-band CP-SAR onboard microsatellite with a total payload of 150 kg as shown in Fig.5 (Urata et al., 2018, 2019). This microsatellite was developed for engineering test of CP-SAR for future global disaster and environmental monitoring.

## **AI Image Processing and Its Applications**

Through collaboration with remote sensing, data science, disaster prevention science, emergency medical science, and sociology, JMRSL aims to develop the field of AI disaster mitigation science centered on satellite big data and spatial AI and strengthen disaster prediction and disaster prevention functions. We aim to establish an AI interdisciplinary hub for disaster mitigation science as shown in Fig.6, and thereby support emergency medical activities by quickly grasping the local situation after a disaster occurs.

Fig.7 shows an example of the AI analysis result of CP-SAR images of land parcels for ownership and road network mapping in Makassar, Indonesia to real-time generating of disaster-affected areas to support the local disaster emergency reaction institutions within 24 hours to 72 hours to rescue the people.

## **Education Activities**

Department of Environmental Remote Sensing promotes the double degree program (DDP) with sister universities of Chiba University (n.d). The DDP conducts research and education for graduate students in the master's and doctorate courses in the field of remote sensing. We also support the students for overseas activities under the ENGINE program of Chiba University where all of our students must go abroad for study and research.

# Latar Belakang : Josaphat dan Radar

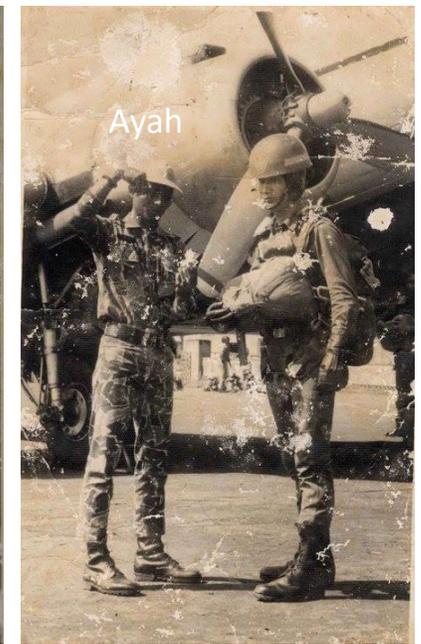

**Josaphat Tetuko Sri Sumantyo** aka "Josaphat" aka "Josh" aka "Tetuko" aka "Tuko" lahir di Pangkalan Udara TNI-AU Sulaiman, Bandung pada tanggal 25 Juni 1970. Josh terlahir dengan Ayah sebagai Instruktur Komando Pasukan Gerak Tjepat (Kopasgat/PGT) TNI-AU dan menggunakan Pangkalan Udara Adisumarmo, Solo sebagai tempat bermain semasa kecilnya.

Pada saat umur lima tahun pada tahun 1975, Josh bermain di bengkel radar TNI-AU Lanud Adisumarmo dekat sang Ayah melatih pasukan di Skadron 401/402, menanyakan asal berbagai jenis radar TNI-AU kepada Ayah. Ternyata jawabannya membuat Josh kaget, karena hampir seluruh radar adalah produk import. Kemudian Tetuko berjanji untuk membangun radar untuk melindungi Ayahnya saat bertugas di medan perang sebagai Komando Kopasgat/PGT, serta melindungi TNI-AU dan Negara Indonesia.

Akhirnya Josh merealisasikan janji kepada Ayah, berupa radar 'only-one' dan 'original' yaitu **circularly polarized synthetic aperture radar (CP-SAR)** untuk pesawat dan satelit pada 13 Maret 2018. Sensor radar penginderaan jarak jauh ini dapat digunakan untuk keperluan kemanusiaan, lingkungan, keamanan negara, kebencanaan hingga misi observasi bulan dan planet seperti yang dilakukan oleh Josh saat ini bersama beberapa badan ruang angkasa dunia.

# All of Earth's Satellites Visualized Who Owns Our Orbit?

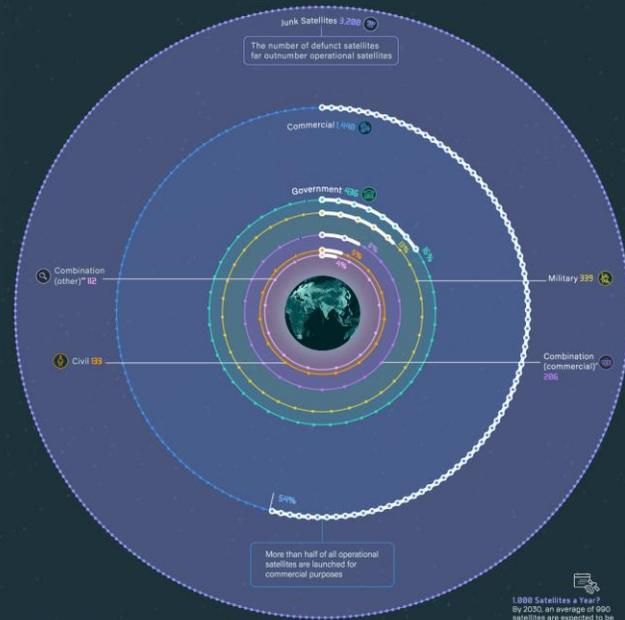

The new space race is on. Hundreds of satellites are launched into Earth's orbit every year for purposes ranging from communications and IoT, to environmental monitoring and border security.

Thousands more defunct satellites are orbiting the planet as space junk. In total, there are nearly 6,000 satellites circling our tiny planet—and that number keeps growing.

# Sensor Optis vs Synthetic Aperture Radar (SAR)

## Sensor Optis

Mudah dimengerti karena menggunakan pantulan sinar matahari

Observasi menggunakan panjang gelombang yang dikenali mata manusia

## Sensor Radar (SAR)

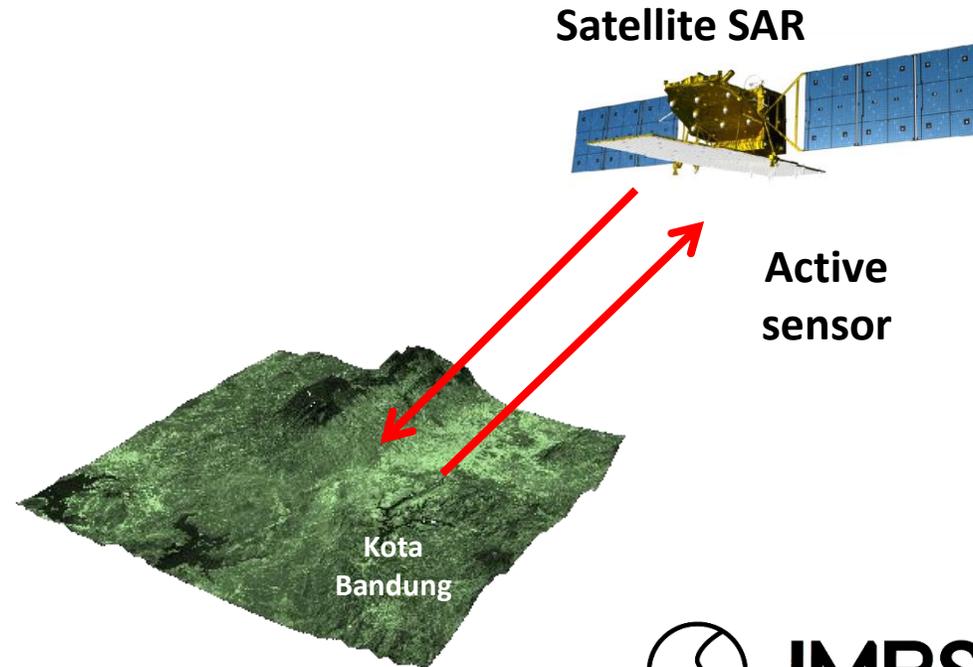

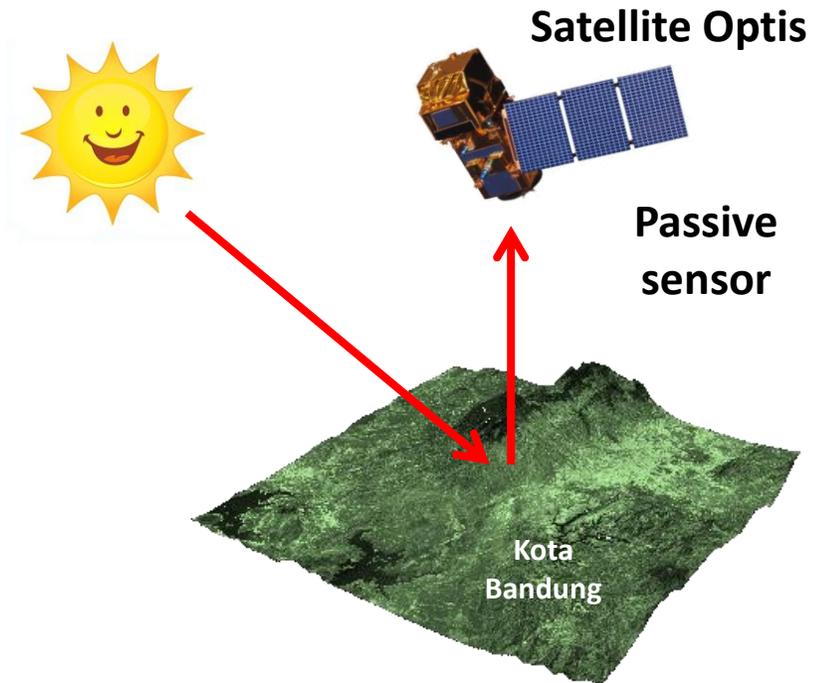

Memancarkan gelombang mikro dan menerimanya kembali (active sensor)

Tidak terbaca oleh mata manusia → sulit dimengerti

Panjang gelombang orde sentimeter

Mekanisme pantulan yang kompleks

Distorsi citra karena teknik observasi ke samping (side looking radar)

- Mudah dimengerti karena menggunakan pantulan sinar matahari
- Observasi menggunakan panjang gelombang yang dikenali mata manusia
- Memancarkan gelombang mikro dan menerimanya kembali
- Tidak terbaca oleh mata manusia → sulit dimengerti
- Panjang gelombang orde sentimeter
- Mekanisme pantulan yang kompleks
- Distorsi citra karena teknik observasi ke samping (side looking radar)

# Circularly Polarized Synthetic Aperture Radar (CP-SAR) ciptaan Josaphat

## Tujuan

- Bencana seperti tanah longsor, gempa, gunung meletus, penurunan tanah dll sering terjadi di permukaan bumi, sehingga memerlukan sensor yang akurat, ringan, tangguh (robust), kaya informasi polarisasi, multi platform untuk pesawat tanpa awak, pesawat terbang, hingga satelit yang dapat dioperasikan di seluruh kondisi cuaca dan malam-siang hari (24 jam/hari).
- Promosi penelitian dan Pendidikan mengenai microwave remote sensing, khususnya synthetic aperture radar (SAR) dan aplikasinya.

## Kelebihan CP-SAR

- Dapat beroperasi di segala platform darat, laut, dan udara, mis. kendaraan, kapal, UAV/Drone, high altitude platform System (HAPS), pesawat, micro/medium/large satellite dll.
- Mengurangi pengaruh ionosfer (Faraday rotation) untuk misi satelit ruang angkasa
- Mengurangi pengaruh misalignment pesawat / satelit
- Efisiensi energi :  $\frac{1}{2}$  power dibandingkan SAR sistem konvensional (linear SAR)
- Data polarisasi lebih kaya dan detail dibandingkan SAR sistem konvensional dll
